Repository analysis with Kibble

Apache Kibble is a suite of tools for analysing and visualising activity in software projects. We use Kibble to analyse the activity, since GitHub repository analysis is geared towards individual repositories, which is untenable for us.

The Kibble Dev instance analyses all Sling GitHub repositories. To view the data, log in via the demo user as described on the dev instance login page. For registering new repositories, please contact a Kibble admin.

Kibble admins: Robert Munteanu
