

Secure Single Sign-On with Apache Directory and Apache Kerberos

Secure Single Sign-On with Apache Directory and Apache Kerberos

Abstract

In conjunction with the Apache Kerberos protocol provider, the Apache Directory can be used as a "realm controller" for Linux and Windows machines. This talk provides an overview of the Kerberos and Change Password protocol workflow. Significant time is spent on the configuration of trust relationships and the configuration of both Linux and Windows machines to use Apache Directory as a Key Distribution Center (KDC).
