

Architecture

Architecture

Camel uses a Java based [Routing Domain Specific Language \(DSL\)](#) or an [Xml Configuration](#) to configure [routing and mediation rules](#) which are added to a [CamelContext](#) to implement the various [Enterprise Integration Patterns](#).

At a high level Camel consists of a [CamelContext](#) which contains a collection of [Component](#) instances. A [Component](#) is essentially a factory of [Endpoint](#) instances. You can explicitly configure [Component](#) instances in Java code or an IoC container like Spring or Guice, or they can be auto-discovered using [URIs](#).

An [Endpoint](#) acts rather like a URI or URL in a web application or a Destination in a JMS system; you can communicate with an endpoint; either sending messages to it or consuming messages from it. You can then create a [Producer](#) or [Consumer](#) on an [Endpoint](#) to exchange messages with it.

The [DSL](#) makes heavy use of pluggable [Languages](#) to create an [Expression](#) or [Predicate](#) to make a truly powerful DSL which is extensible to the most suitable language depending on your needs. The following languages are supported

- [Bean Language](#) for using Java for expressions
- [Constant](#)
- the unified [EL](#) from JSP and JSF
- [Header](#)
- [JsonPath](#)
- [XPath](#)
- [Mvel](#)
- [OGNL](#)
- [Ref Language](#)
- [ExchangeProperty](#) / [Property](#)
- [Scripting Languages](#) such as
 - [BeanShell](#)
 - [JavaScript](#)
 - [Groovy](#)
 - [Python](#)
 - [PHP](#)
 - [Ruby](#)
- [Simple](#)
 - [File Language](#)
- [Spring Expression Language](#)
- [SQL](#)
- [Tokenizer](#)
- [XPath](#)
- [XQuery](#)
- [VTD-XML](#)

Most of these languages is also supported used as [Annotation Based Expression Language](#).

- [EndpointCompleter](#)
- [Error Handler](#)
- [Exchange](#)
- [Exchange Pattern](#)

- Expression
- HTTP-Session Handling
- Injector
- Intercept
- Inversion Of Control With Smart Defaults
- Languages
- Lifecycle
- OnCompletion
- Pluggable Class Resolvers
- Predicate
- Processor
- ProcessorFactory
- Registry
- RouteBuilder
- RoutePolicy
- Routes
- RX
- Security
- ServicePool
- Stream caching
- Threading Model
- ToAsync
- Tracer
- Transport
- Type Converter
- URIs
- UuidGenerator
- Xml Configuration

Diagram

Camel

Integration Engine And Router

Camel Endpoints

- * Camel can send messages to them
- * Or Receive Messages from them

Filter Processor

Router Processor

Camel Processors

- * Are use to wire Endpoints together
- * Routing
- * Transformation
- * Mediation
- * Interception
- * Enrichment
- * Validation
- * Tracking
- * Logging

Camel Components

- * Provide a uniform Endpoint Interface
- * Act as connectors to all other systems

JMS Component

JMS API

JMS Provider
ActiveMQ | IBM |
Tibco | Sonic ...

HTTP Component

Servlet API

Web Container
Jetty | Tomcat | ...

HTTP Client

File Component

File System

Local File
