Introduction to Hadoop

Owen O'Malley
Yahoo Inc!
omalley@apache.org

Hadoop: Why?

- Need to process 100TB datasets with multiday jobs
- On 1 node:
 - scanning @ 50MB/s = 23 days
 - MTBF = 3 years
- On 1000 node cluster:
 - scanning @ 50MB/s = 33 min
 - MTBF = 1 day
- Need framework for distribution
 - Efficient, reliable, easy to use

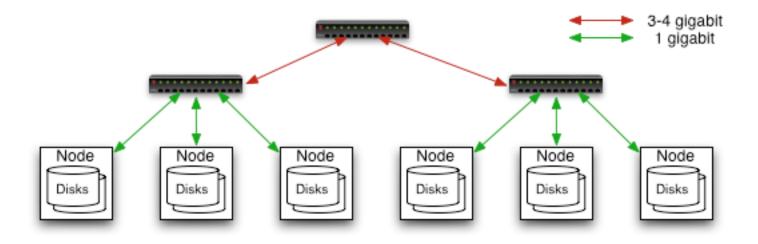

Hadoop: How?

- Commodity Hardware Cluster
- Distributed File System
 - Modeled on GFS
- Distributed Processing Framework
 - Using Map/Reduce metaphor
- Open Source, Java
 - Apache Lucene subproject

Commodity Hardware Cluster

- Typically in 2 level architecture
 - Nodes are commodity PCs
 - 30-40 nodes/rack
 - Uplink from rack is 3-4 gigabit
 - Rack-internal is 1 gigabit

Distributed File System

- Single namespace for entire cluster
 - Managed by a single namenode.
 - Hierarchal directories
 - Optimized for streaming reads of large files.
- Files are broken in to large blocks.
 - Typically 64 or 128 MB
 - Replicated to several datanodes, for reliability
 - Clients can find location of blocks
- Client talks to both namenode and datanodes
 - Data is not sent through the namenode.

Distributed Processing

- User submits Map/Reduce job to JobTracker
- System:
 - Splits job into lots of tasks
 - Schedules tasks on nodes close to data
 - Monitors tasks
 - Kills and restarts if they fail/hang/disappear
- Pluggable file systems for input/output
 - Local file system for testing, debugging, etc...

Map/Reduce Metaphor

- Abstracts a very common pattern (munge, regroup, munge)
- Natural for
 - Building or updating offline databases (eg. indexes)
 - Computing statistics (eg. query log analysis)
- Software framework
 - Frozen part: distributed sort, and reliability via reexecution
 - Hot parts: input, map, partition, compare, reduce, and output

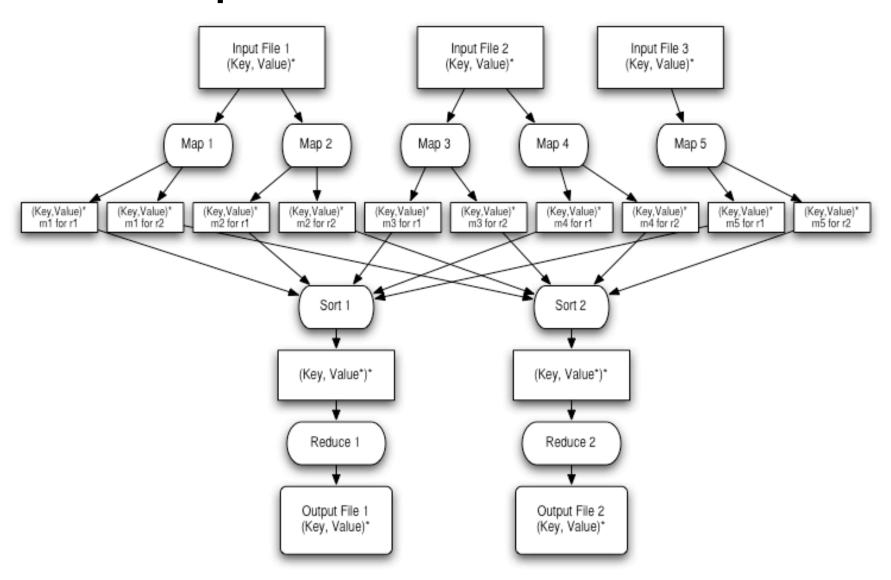

Map/Reduce Metaphor

- Data is a stream of keys and values
- Mapper
 - Input: key1, value1 pair
 - Output: key2, value2 pairs
- Reducer
 - Called once per a key, in sorted order
 - Input: key2, stream of value2
 - Output: key3, value3 pairs
- Launching Program
 - Creates a JobConf to define a job.
 - Submits JobConf and waits for completion.

Map/Reduce Dataflow

Map/Reduce Optimizations

- Overlap of maps, shuffle, and sort
- Mapper locality
 - Schedule mappers close to the data.
- Combiner
 - Mappers may generate duplicate keys
 - Side-effect free reducer run on mapper node
 - Minimize data size before transfer
 - Reducer is still run
- Speculative execution
 - Some nodes may be slower
 - Run duplicate task on another node

HOWTO: Setting up Cluster

- Modify hadoop-site.xml to set directories and master hostnames.
- Create a slaves file that lists the worker machines one per a line.
- Run bin/start-dfs on the namenode.
- Run bin/start-mapred on the jobtracker.

HOWTO: Write Application

- To write a distributed word count program:
 - Mapper: Given a line of text, break it into words and output the word and the count of 1:
 - "hi Apache bye Apache" ->
 - ("hi", 1), ("Apache", 1), ("bye", 1), ("Apache", 1)
 - Combiner/Reducer: Given a word and a set of counts, output the word and the sum
 - ("Apache", [1, 1]) -> ("Apache", 2)
 - Launcher: Builds the configuration and submits job

Word Count Mapper

Word Count Reduce

Word Count Launcher

```
public static void main(String[] args) throws IOException {
   JobConf conf = new JobConf(WordCount.class);
   conf.setJobName("wordcount");

   conf.setOutputKeyClass(Text.class);
   conf.setOutputValueClass(IntWritable.class);

   conf.setMapperClass(WCMap.class);
   conf.setCombinerClass(WCReduce.class);
   conf.setReducerClass(WCReduce.class);

   conf.setInputPath(new Path(args[0]));
   conf.setOutputPath(new Path(args[1]));

   JobClient.runJob(conf);
}
```

```

Running on Amazon EC2/S3

- Amazon sells cluster services
 - EC2: \$0.10/cpu hour
 - S3: \$0.20/gigabyte month
- Hadoop supports:
 - EC2: cluster management scripts included
 - S3: file system implementation included
- Tested on 400 node cluster
- Combination used by several startups

Hadoop On Demand

- Traditionally Hadoop runs with dedicated servers
- Hadoop On Demand works with a batch system to allocate and provision nodes dynamically
 - Bindings for Condor and Torque/Maui
- Allows more dynamic allocation of resources

Scalability

- Runs on 1000 nodes
- 5TB sort on 500 nodes takes 2.5 hours
- Distributed File System:
 - 150 TB
 - 3M files
