How can we change which methods are excused from validation

By default, the methods `input`, `back`, `cancel`, and `browse` are excluded from validation. These method names are provided as a parameter to the validation interceptor as configured in the `struts-default` package. To change the excluded methods, we just need to change the parameter.

```xml
<action name=xxx>
  <interceptor-ref name="defaultStack">
    <param name="validation.excludeMethods">method1,method2</param>
  </interceptor-ref>
</action>
```
