How do I enable encoding in my forms

If you have enabled all possible UTF-8 settings, and your application's forms still aren't handling your character set correctly, it may help to

- add accept-charset as attribute to the form tag, OR
- create a hidden tag with name "charset" that the browser will fill in

For more, see FORM submission and i18n

An enhancement is planned for SAF 2.0 that may solve this problem. The change would be to add a default overridable UTF-8 encoding the form template.
