

# Naming (JNDI)

This page describes how the Geronimo server puts the names of your Java EE Connector Architecture (JCA) objects, for example datasource and Java Messaging Service (JMS) resource groups, and Enterprise Java Beans (EJBs) in the JNDI namespace so that clients may access them. Geronimo supports all the following JNDI naming schemes:

Categories	naming schemes
Java EE 6 naming context	java:comp/ java:module/ java:app/ java:global/
OSGi naming context	osgi:service/ osgi:servicelist/
Aries naming context	aries:services/
Geronimo global naming context	jca:/
