

# How to build the portlet WAR for a specific portal server

## Build instructions

Building a portlet WAR, step by step.

- Run `ant` from the `webapp` project directory
- `cd` to `webapps` directory
- To build a portlet webapp, run: `ant build-portal`
- Use the `container` system property to target a specific container, e.g. `'-Dcontainer=exo'`.
  - Several containers are supported.
  - Example command:

```
•  
  ant build-portal \-Dcontainer=jboss-portal-2.2
```

- Check the `etc/yourcontainer` directory for a README file. If available, check for further instructions.
- Deploy the WAR to your portal server

The referenced Ant build file is not yet available for Struts 2
