

Customizing XML

Customizing the XML

The `Xml Configuration` is defined by JAXB POJOs in the `org.apache.camel.model.*` package and its sub packages.

- If you are adding a new class you must edit the `jaxb.index` file to add the class name! (One day we could hopefully have these autogenerated by a maven plugin)
- If you add a new package, you must
 - add a `jaxb.index` file in `src/main/resources/...`
 - add a `package-info.java` file like the other model packages
 - edit the `JAXB_PACKAGES` string in the `CamelNamespaceHandler` class in `camel-spring`
- whenever you add anything to the XML - add some unit tests!
 - if you add a new model package and want add a unit test in `XMLPaserTest`, you also need to add your package into the `jaxb` context in `XmlTestSupport`
