

How to build the portlet WAR for a specific portal server

Build instructions

Building a portlet WAR, step by step.

- Run `ant` from the `webapp` project directory
- `cd` to `webapps` directory
- To build a portlet webapp, run: `ant build-portlet`
- Use the `container` system property to target a specific container, e.g. `'-Dcontainer=exo'`.
 - Several containers are supported.
 - Example command:

```
•  
  ant build-portlet \-Dcontainer=jboss-portal-2.2
```

- Check the `etc/yourcontainer` directory for a README file. If available, check for further instructions.
- Deploy the WAR to your portal server

The referenced Ant build file is not yet available for Struts 2
