

Restarting host components via the API

Restarting host components / refreshing client configs

Here is how to restart specific host components:

```
curl -uadmin:admin -H 'X-Requested-By: ambari' -X POST -d '{
  "RequestInfo":{
    "command":"RESTART",
    "context":"Restart ZooKeeper Client and HDFS Client on c6401.ambari.apache.org",
    "operation_level":{
      "level":"HOST",
      "cluster_name":"c1"
    }
  },
  "Requests/resource_filters":[
    {
      "service_name":"ZOOKEEPER",
      "component_name":"ZOOKEEPER_CLIENT",
      "hosts":"c6401.ambari.apache.org"
    },
    {
      "service_name":"HDFS",
      "component_name":"HDFS_CLIENT",
      "hosts":"c6401.ambari.apache.org"
    }
  ]
}' http://localhost:8080/api/v1/clusters/c1/requests
```

Note: When RESTART is applied to a CLIENT, it refreshes the configs.
