

Website Tips

The website is written with [Jekyll](#) markdown.

For small changes, you can use the edit button at the top right of each page.

For larger changes, you can run:

```
$ ./gradlew :beam-website:serveWebsite
```

Which will start a docker container and serve the website to <http://localhost:4000>. After one hour, the docker container will exit and you will need to re-start it.

You can also check links with:

```
$ ./gradlew :beam-website:testWebsite
```
