

How do I debug my route

How do I debug my route?

If you've created a route and its not doing what you think it is you could try using one of these features from [version 1.4 onwards](#)

- [Tracer](#) to trace in commons-logging / log4j each step that Camel takes
- [Debugger](#) to let you set breakpoints at points in the route and examine historic message exchanges
- [Debug](#) from your unit test if you use the Camel `camel-test` component

Some [third party tools](#) offers Apache Camel route debugging.
