

Registry

Registry

Camel supports a pluggable [Registry](#) plugin strategy. This allows Camel to easily work with some kind of registry like

- [SimpleRegistry](#) which is a simple `java.util.Map` based registry.
- [JndiRegistry](#) which uses the [JNDI](#) `InitialContext` as the registry
- [ApplicationContextRegistry](#) if you are using Spring, it uses the `ApplicationContext` as the registry

You can also access the Registry from the [CamelContext](#) via the [camelContext.getRegistry\(\)](#) method
