

# Creating a SlingPostServlet post processor

In order to create a post processor to the SlingPostServlet (will be systematically called after POST is processed in transient space, before save is done):

- create a service implementing `org.apache.sling.servlets.post.SlingPostProcessor`
- implement the post processing in `process(SlingHttpServletRequest request, List<Modification> changes)`

Note that :

- `service.ranking` property can be specified to order the post processor among the others
- every change done to the repository should be added to List `changes`
