

Custom State Tracking

This is an example (based on Link-o-matic of wicket-examples) of how to use customized state tracking.

Play with this and see how it reacts on using your back-button.

```
// Action link counts link clicks on works with onclick handler
final Link actionOnClickLink = new Link("actionOnClickLink")
{
    public void onClick()
    {
        addStateChange(new Change()
        {
            private int tmpCount = Home.this.onClickLinkClickCount;
            public void undo()
            {
                onClickLinkClickCount = tmpCount;
            }
        });
        onClickLinkClickCount++;
    }
};
```
