

VTD-XML

VTD-XML

Available as of Camel 2.10

The VTD-XML component supports the [VTD-XML Library](#) for very fast and efficient [XPath](#) processing. The `camel-vtdxml` library is provided by the [Camel Extra](#) project which hosts all *GPL related components for Camel.

Using

The VTD-XML is implemented as a Camel [Language](#) which allows you to easily use it in the Camel routes. This component is particular efficient for splitting files or other big payloads.

For example to split a big file containing many persons, you could do:

```
from("file:inbox")
  .split().vtdxml("/persons/person").streaming()
  .to("activemq:queue:person")
  .end()
```

And in XML DSL

```
<route>
  <from uri="file:inbox"/>
  <split streaming="true">
    <vtdxml>/persons/person</vtdxml>
    <to uri="activemq:queue:person"/>
  </split>
</route>
```

This will run the [Splitter](#) in streaming mode using the `vtdxml` language.
