

Installed size comparison (1.1.1, 1.2, 2.0)

One of the issues that has been recently brought up is the increase in the installed footprint of Geronimo. The following table shows the size (in Megabytes) of each of the directories in an unpacked tomcat install of the latest version of each level.

The first line of the table shows the total install size.

In order to make the comparison more 'fair' some directories that were directly under repository in 1.1.1 have been mapped onto their 'new home' under 1.2 and 2.0 (eg: geronimo -> org/apache/geronimo).

Remember, that the subdirectory sizes are already summarized into their parents!

Directory	1.1.1	1.2	2.0
