

Apache Camel Transport

[Apache Camel](#) offers another Transport for CXF which is quite interesting. The [Camel Transport for CXF](#) allows you to attach a CXF service to an Apache Camel endpoint. This makes it very easy to use Camel's extensive routing capabilities together with Apache CXF. For example if you attach a CXF service to the address "camel://direct:MyService" you can offer it on JMS by using the route from("jms://queue.Myqueue").to("direct:MyService"). The Howto "[Better JMS Transport for CXF Webservice using Apache Camel](#)" shows you how to use Apache Camel for easier JMS Transport configuration than with the current native CXF JMS Transport. But of course Camel offers [much more](#) than only JMS.
