Project Description

Apache Gora open source framework provides an in-memory data model and persistence for big data. Gora supports persisting to column stores, key value stores, document stores and RDBMSs, and analyzing the data with extensive Apache Hadoop MapReduce support. Even Spark is so powerful compared to Map/Reduce which Gora currently supports; there is no Spark backend for Gora. This proposal aims to develop a solution for Gora to support Spark.

Checklist

Read data over GoraInputFormat via Spark.

Developed and engine for Gora - Spark integration.

Implemented LogAnalytics example with Gora - Spark style.

Next Steps

Prepare midterm report.
