

# Why didn't my action tag get executed when I have validation errors

The class related to an action tag will not execute when a validation error is exposed and the (default) `ValidationInterceptor` and `DefaultWorkflowInterceptor` are in place.

The default configuration excludes several methods from validation, including `input`. If the input method is specified by the action tag, then validation will not fire.

```
<s:action name="myActionAlias!input" executeResult="false" />
```
