

Can I change templateDir on a per-page basis

The default template directory is passed to the page through a `templateDir` variable. To change the template directory for a page, use the `set` tag to change the `templateDir` variable. The variable can be changed using a static value or property.

Static Value

Change to the "template" directory.

```
<s:set name="templateDir" value="'template'" scope="page" />
```

Property

Change to the theme name indicated by the `myTemplateDir` property.

```
<s:set name="theme" value="%{myTemplateDir}" scope="page" />
```
