

# RhinoShell

## Rhino javascript shell

It can be very useful to run a Rhino shell to learn the subtleties of the Rhino javascript syntax used by [Flow](#).

This is explained [here](#), but basically you can start the shell with

```
java -cp path-to-rhino-jar org.mozilla.javascript.tools.shell.Main
```

Using Cocoon's version of rhino this becomes

```
java -cp lib/core/rhino1.5r4-continuations-20040228.jar org.mozilla.javascript.tools.shell.Main
```
