Creating a new repository

Git

Repository creation is now a self-service method that lets PMCs request and create their own git repos. If someone submits a request ticket to Infra, let them know that any PMC member can do it from the Gitbox New Repository site.

Subversion

1. `svn mkdir https://svn.apache.org/repos/$location/$name`
2. Add information to `infrastructure-puppet/modules/subversion_server/files/authorization/asf-mailer.conf` for e-mail notifications and permissions
