Welcome to the Infrastructure Confluence Wiki!

If you can't find the information you want listed in the Topical Index, below, you can browse the Navigation Menu to the left or use the search field above, specifying the Infrastructure space.

If you have suggestions, or would like to contribute to this wiki, get in touch with the Infrastructure Team.

This wiki is an essential resource for the Infra team, and a secondary resource for PMCs and committers.

- For introductory information, visit the dev area of the ASF website.
- For access to information and services that Apache project PMCs and committers need, visit the Infra site.

## Contents
- Infra project management
  - Infra monitoring and incident response
- Infra Policies
- Services
  - ASF accounts
  - Backups
  - Bug tracking
  - CI/CD
    - Buildbot
    - Docker
    - Jenkins
  - Confluence wiki
  - Content distribution
  - DNS
  - Email
  - Jira
  - Slack
  - LDAP
  - Localization
  - Puppet
  - Security
    - Certificates
    - Version control
      - git
      - svn
      - nexus
  - Website tools
    - Website tools
  - Machines and VMs
    - Machines
    - Virtual machines
  - Processes
    - Account processes
    - Project processes
    - Package processes
  - Volunteers
  - Other
  - Archived pages

## Draft pages, not yet complete
- Building and deploying web sites with PyPubSub, Jenkins, and Buildbot
- Service Priorities
  - The history of Infra

Version control
git

- Batch changing default branch for multiple repos
- Creating a new repository
- Git -.asf.yaml features
- Git repos are out of sync
- Git, GitHub and Gitbox
- Github Actions to DockerHub
- GitHub Pages
- GitHub repo status and public_repo tokens
- Github Secrets and Tokens
- GitHub webhook relay service
- Publish a huge project website without checking it into Git

svn

- Creating a new repository
- Subversion - test a new master
- Subversion Administration
- Subversion basics

nexus

Content by label

There is no content with the specified labels

Website tools

- Apache CMS
- Building and deploying web sites with PyPubSub, Jenkins, and Buildbot
- Git -.asf.yaml features
- GitHub Pages
- How Apache Jena migrated from the CMS
- Jenkins
- Lets Encrypt
- Pelican and Buildbot for websites
- Project Websites
- Publish a huge project website without checking it into Git

Machines and VMs

Machines

• Subversion basics

Use labels for everything

This page builds the index based on the labels on pages, and then alphabetically by title within each section. Label any page that you want to appear in the index by clicking the label icon beside the page title. Type ‘infra-$service’ in the search field and select the label that fits best. If there is no appropriate label, you can create one. If you do that, though, you need to add a section for that label to the index. Review the existing labels here https://cwiki.apache.org/confluence/labels/listlabels-alphaview.action
