

Website Tips

The website is written with [Jekyll](#) markdown.

How to edit the Apache Beam website?

- For small changes, use the **Edit**  option at the top right of each page.
- For larger changes:
 1. Execute:

```
$ ./gradlew :website:serveWebsite
```

2. It starts a Docker container and serves the website to <http://localhost:1313>. After one hour, the docker container will exit and you will need to re-start it.
3. You can also check links with:

```
$ ./gradlew :website:testWebsite
```

Pull requests with website changes will automatically be staged to GCS. The URL is at the end of the console logs for `beam_PreCommit_Website_Stage_GCS_Commit`, and is of the form `http://apache-beam-website-pull-requests.storage.googleapis.com/{PR_NUM}/index.html`
