

Initial configuration

[Getting and installing Geronimo](#)[Installing and running](#)[Installing prerequisite software](#)

Initial configuration

Apache Geronimo provides a couple of configuration files where you can edit some of the parameters before starting the server. Look into the following topics for more details.

- [Changing the default port numbers](#)
- [Changing the username and password](#) — The default administration user name and password for the Geronimo Administrative Console and command line deployment tool is system and manager respectively. You can change these defaults
- [Substituting one module with another](#) — You may want to change the version of jars or plugins from those used when your Geronimo server was assembled, or completely replace one with another.

Additional configuration changes can be made on the `config.xml` file available in the `<geronimo_home>/var/config/` directory.
