

How to modify a package after buildr has created it

Buildr's packaging tasks are built such if you write

```
packages.first.enhance do |task|  
  puts File.exist?(task.name)  
end
```

it will print `false` (That is, your code is executed before the package is actually created.) This is so that you can enhance the task to, e.g., add or remove files from archive.

This is different from how `enhance` usually behaves — usually the `enhance` block is executed after the existing defined behavior of the task. If you want the normal behavior, enhance twice:

```
packages.first.enhance do |task|  
  task.enhance do  
    puts File.exist?(task.name) # prints true  
  end  
end
```
