

LauriPitkanen

We use Cocoon mainly for Rapid Web Application Development:

- **RDBMS:** PostgreSQL, MySQL, MsSQL
- **Database manipulation:** [ESQL](#), XSPAction, [ModularDatabaseActions](#)
- **User interface:** [HTML](#), [WML](#), [FormValidatorAction](#), [SimpleFormTransformer](#)
- **Reporting/publishing:** FOP, XLSSerializer, [RtfGeneration](#)

I am anxiously waiting for Woody 1.0 release and hopefully capable to participate in [UnifiedSQLTransformerAndLogicsheet](#) work etc. in the future.

Right now my big question is how to manipulate our databases if|when we switch to Cocoon Forms.

I'm not too excited about the [O/R](#) idea (yet) because we use also stored procedures and I'd like to keep things relatively simple.
