

Pod2ManRedHat

On Red Hat 9, I get 'could not locate your pod2man program'. Workaround?

Use this line to generate the Makefile before running "make":

```
LANG=C perl Makefile.PL
```

or alternatively,

```
unset LANG
perl Makefile.PL
```

or alternatively,

Edit your `/etc/sysconfig/i18n` file and change the "LANG" value from "en_US.UTF-8" to "en_US"

This will work around this bug in the RH9 perl package.
