Why do Maven project names and other details show up in my pages?

Tapestry and maven both use the same syntax for dynamic portions of files: the `${...}` syntax. When Maven is copying resources from `src/main /resources`, and when filtering is *enabled* (which is not the default), then any expansions in *Tapestry templates* that match against Maven project properties are substituted. If you look at the deployed application you'll see that `${name}` is gone, replaced with your project's name!

The solution is to update your `pom.xml` and ignore any .tml files when copying and filtering:

pom.xml (partial)

```
<resource>
  <directory>src/main/resources</directory>
  <excludes>
    <exclude>**/*.tml</exclude>
  </excludes>
  <filtering>true</filtering>
</resource>

<resource>
  <directory>src/main/resources</directory>
  <includes>
    <include>**/*.tml</include>
  </includes>
  <filtering>false</filtering>
</resource>
```
