

# struts.properties

✔ All properties can also be set using [Constant Configuration](#) in an XML configuration file.

The framework uses a number of properties that can be changed to fit your needs. To change any of these properties, specify the property key and value in an `struts.properties` file. The properties file can be located anywhere on the classpath, but it is typically found under `/WEB-INF/classes`

The list of properties can be found in `struts-default.properties` (inside `struts2.jar`).

## struts-default.properties

Error formatting macro: snippet: java.lang.NullPointerException
