

About This Wiki

From my observation, some part of document change frequently, like: **Configuration, Rest API** ; while other part of document change rarely. At present, update and **preview** document is painful for our contributor. Contributor has to follow complex procedure, understand how to use **Jekyll**, prepare **docker** env, add new markdown file and raise a PR to **document branch**. A lot of effort has been spent on preparation and waiting.

Firstly, using wiki make **social interaction** like discussion/comment much easier so that author may collect comments more easily and quicker. Secondly, wiki has **a lot of features**, like **page history** so that writer may compare with previous version and checkout/revert to some specific history version very easily. Finally, wiki provided a lot of type to write wonderful **format(macors)**, such as table of content, inline source code, plantUML, tables etc.

Here, I propose to move some part of documentation from original **document branch** to **Apache Kylin 's Wiki** since **Kylin 4.0**, to make updating documentation much easier. Since **Confluence Wiki** is an easy-to-use **rich text editor**, contributor can update it with less effort. For contributor who is willing to edit a wiki page, please refer to this page ([How to contribute wiki](#)) .
