

Tapestry 5.6.1 released

Tapestry 5.6.1 is a bugfix release. To upgrade, just update the dependency in your build configuration (Maven POM, Gradle build script, etc.) – or Download the new JAR file -- and the new version should just work.

The only change is  [TAP5-2642](#) - Tapestry 5.6.1 asset request fails due to missing dependency RESOLVED, which caused asset requests to fail if your webapp doesn't have Apache commons-lang in the classpath.
