

Panels and borders

What's the difference?

Both Panels and Borders have their own markup file, but the markup is used in different ways:

The [Border](#) component inserts markup before and after its child components.

```
{panel}
  <html>
    <body>
      <div wicket:id="myBorder">
        <!-- Border markup -->
        <span wicket:id="myContent">content</span>
        <!-- Border markup -->
      </div>
    </body>
  </html>
{panel}
```

The [Panel](#) component inserts markup into the body of the tag.

```
{panel}
  <html>
    <body>
      <div wicket:id="myPanel">
        <!-- Panel markup -->
      </div>
    </body>
  </html>
{panel}
```
