

Release-PPMC-Plan

How to do releases?

- A [Guide to Release Management During Incubation](#) has details for Apache requirements.

ToDo's for the first Apache OpenOffice release:

- create a EOL message for the binfilters
 - generate writing without too much and deep technical stuff
 - AOO 3.4 will be the last release with read support for the old binary file format (write already disabled)
 - with the next release it will not be possible to read or write these kind of files
 - alternatives are:
 - use the XML-based ODF file formats for new files
 - convert all old files into the ODF-based formats
 - keep the AOO 3.4 release as long as no migration plan was setup
 - as fallback there are still older, non-Apache releases in the archive ([link](#))
