

Setup web project

Setup

To build a wicket web application you need to understand the WAR-file layout and what the `WEB-INF/lib` is all about, otherwise you should go read the [Introduction on Java web applications](#).

Quick start

The following JAR-files are the bare minimum needed in `WEB-INF/lib` to develop a wicket application:

- `wicket-1.3.0.jar`
- `slf4j-api-1.4.2.jar`
- `slf4j-jdk14-1.4.2.jar`

The use of Servlet filters in the `web.xml` configuration is explained [here](#).

That's it, now go kick the tires!

Maven

If you have [maven](#) installed there is an archetype that can get you up to speed quickly. See the [quickstart](#)

Eclipse, NetBeans, IntelliJ

There are descriptions at the [Wicket Quickstart](#) on how to set up your favourite development environment.

Wizardry

[qwicket](#) can create a ready made project for you.
