

August 2012 Board Report

Apache Buildr is a Ruby-based build system for Java-based applications, including support for Scala, Groovy and a growing number of JVM languages and tools.

After almost a year without release, we finally got our release act together and published Buildr 1.4.7 (incl. 70+ fixes/changes/enhancements) on May 29th.

Outside of a surge surrounding the release, the mailing lists have been relatively quiet in past 3 months. We continue to receive contributions at a rate of about one per month on average.

We have no issues that require board attention.
