

User action flows

Version Warning

The content below is for Apache Syncope <= 1.2 - for later versions the [Reference Guide](#) is available.

The figure below summarizes the various flows involving user-related CRUD operations.

User-related operations can be:

1. initiated by REST calls
 - a. via `UserController` - an operation is requested on a given user
 - b. via `TaskController` - a synchronization task is requested for execution
2. triggered by Quartz

At this point `UserController` or `SyncResultHandler` will take care of:

1. invoking the [defined workflow adapter](#) (via `UserWorkflowAdapter`)
2. creating the needed `PropagationTask` instances via `PropagationManager` and executing via `PropagationTaskExecutor`
3. generating the configured notifications via `NotificationManager`

In addition to this, the `SyncResultHandler` will consider the provided user template in the given `SyncTask` when creating or updating users.
