

# Release Notes 5.3.7

[Release Notes 5.3.6](#)[Release Notes](#)[Release Notes 5.3.8](#)

This is the consolidated list of changes between Tapestry versions 5.3.6 and 5.3.7. Tapestry 5.3.7 is a drop-in replacement for prior Tapestry 5.3 releases. To upgrade, just update the Maven dependency in your POM file (or [download](#) the new JAR file) and the new version will just work. However, please review the [How to Upgrade](#) instructions before upgrading.

This is a bug fix release, mainly focused on three aspects:

- make Tapestry work better under Tomcat
- minimize the possibility of clash for generated ids
- let the BeanEditor be more JSR-303 friendly

Some work has been made on the form component too.

As with any Tapestry upgrade, be sure to change your [application's version number](#).
