

RESTful Services

RESTful Services

There are different ways to build RESTful services with CXF.

1. [JAX-RS](#): CXF implements JAX-RS 2.0 (JSR-339) and JAX-RS 1.1 (JSR-311): Java API for RESTful Web Services. This provides a standard way to build RESTful services in Java.
2. [JAX-WS Provider and Dispatch](#): It is possible to create RESTful services with the JAX-WS Provider and Dispatch APIs.
3. [HTTP Binding](#): The HTTP binding provides a flexible way of creating resources and mapping them to operations in your service. This can currently be done via annotations or a convention based mapping.
Note : HTTP Binding has been removed from CXF 2.6.0.
