## **Performance monitoring**

Administering the Apache Geronimo Server

Starting and stopping the server 🗘

For monitoring the Web server performance the Web Server Manager portlet is available by selecting Web Server on the Console Navigation menu on the left hand side. Currently, this feature is only supported on the Jetty distribution of Apache Geronimo. By default this portlet is not enabled, click on the e nable button to start collecting statistics.

Web Server Manager	<u>help</u> [view]
Statistics are not currently being collected.  enable	

Once enable you will start collecting information on the number of requests, concurrent connections, requests duration, etc. The following figure illustrates all the values being collected.

Statistic			Total		
Total Request Count			140		
Total Connection Count			1		
Total Error Count	0				
	Current		Low	High	
Active Request Count	1		0	1	
Connection Request Count	1		105	105	
Open Connection Count		1	0	1	
	Count	Min Time	Max Time	Total Time	
Request Duration	140	0	109	1144	
Connection Duration	1	47344	47344	47344	

The three links at the bottom let you refresh the current statistics, disable the portlet and stopping the collection of new data and reset the data collected.

Note that any request from you via the Geronimo Administration Console (for example refreshing statistics) will be also reflected in this data collection.
