

2014-12-17 Apache VCL Board Report

DESCRIPTION

VCL is a modular cloud computing platform which dynamically provisions and brokers remote access to compute resources including virtual machines, bare-metal computers, and resources in other cloud platforms. A self-service web portal is used to request resources and for administration. VCL became a TLP on June 20, 2012.

CURRENT ACTIVITY

- * The next release of VCL was pushed back due to an underestimate of the amount of work remaining. We plan to create a release candidate next week.
- * Almost all of the development work is complete. Work is wrapping up to add NAT support and a few minor improvements.
- * After this release, we will work to improve how the project handles release planning and management. It has been a very long time since our last release (12/12). Some discussion has started in the thread referenced as [1].
