

autolink

Wicket has an feature to automatically convert static references in the HTML markup to dynamic links.

To only convert some references to dynamic links, surround the HTML markup parts by `<wicket:link>...</wicket:link>` tags:

```
<html>
  <head>
    <title>Title</title>
  </head>
  <body>
    <wicket:link>
      <a href="AnotherPage.html">Go to another page</a>
    </wicket:link>
  </body>
</html>
```

To convert all links in all markups, set the corresponding property in the markup settings:

```
public class OurApplication extends WebApplication {
    ...
    protected void init() {
        ...
        getMarkupSettings().setAutomaticLinking(true);
        ...
    }
    ...
}
```

Unfortunately, it seems not to work out-of-the-box when the reference points to static resources outside the `WEB-INF/classes/` directory. For a work-around, please take a look at [WICKET-581](#).
