Cloud Install

Fully Automated 10 Node Cluster on AWS

This install fully automates the provisioning of Apache Metron on Amazon EC2 infrastructure. Starting with only your Amazon EC2 credentials, this project will create a fully-functioning, end-to-end, multi-node cluster running Apache Metron.

Warning: Amazon will charge for the use of their resources when running Apache Metron. The amount will vary based on the number and size of hosts, along with current Amazon pricing structure. Be sure to stop or terminate all of the hosts instantiated by Apache Metron when not in use to avoid unnecessary charges.

See the following for instructions: Apache Metron on Amazon EC2
