

Handle user requests (including self registration)

Version Warning

The content below is for Apache Syncope <= 1.2 - for later versions the [Reference Guide](#) is available.

1. Introduction
2. Self registration
3. The self registration process
 1. Submit anonymous user request
 2. Manage user request
4. Authenticated user request (Edit profile)

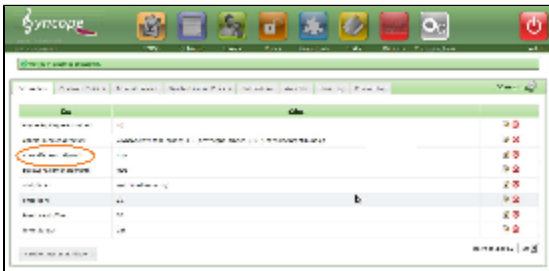

Introduction

This page aims to show how user requests are handled; this cover self registration as well.

Self registration

Self registration can be enabled or disabled by setting the value of property `createRequest.allowed` to `true` or `false`.

This can be done either via [REST](#) or through [administration console](#).

Self registration is enabled by default in [embedded mode](#) and disabled by default in [real world deployments](#).

The self registration process

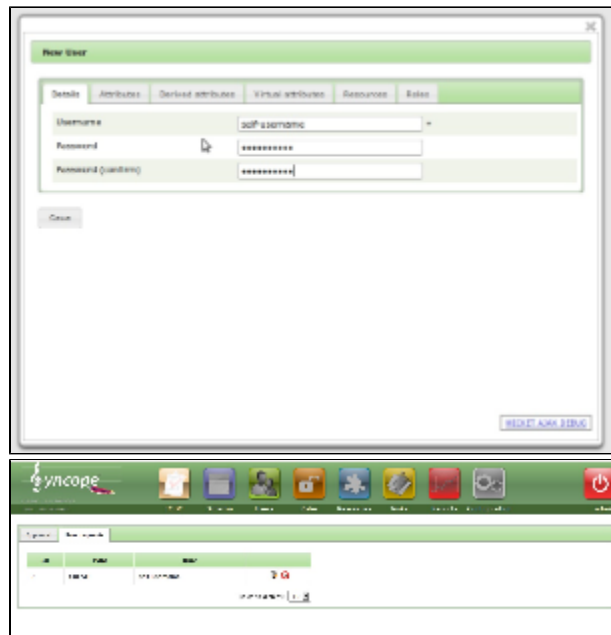

Submit anonymous user request

When enabled, anonymous users can access the self registration form by clicking on the *Self registration* link available at the bottom of the administration console login form.

When an anonymous user submits the self registration form, an *UserRequest* is created and forwarded to designated administrators. Requests will be available in the administration console under the *TODO > User request* tab.

The login page features the Syncope logo at the top. Below it, there are two input fields: 'User id' with the text 'admin' and 'Password' with masked characters. A language dropdown menu is set to 'English'. Below these are 'Login' and 'Self registration' buttons. The 'Self registration' button is circled in orange.

The 'New User' window has tabs for 'Details', 'Attributes', 'Derived attributes', 'Virtual attributes', 'Resources', and 'Roles'. The 'Details' tab is active, showing fields for 'Username' (set to 'admin'), 'Password', and 'Password (confirm)'. A 'Cancel' button is at the bottom left, and a 'REGISTER USER' button is at the bottom right.

Manage user request

Designed administrators can select a user request for reviewing (and possibly modifying) attributes, resources and roles. Once the request has been approved, the user is created and a new [workflow](#) instance is started.

Authenticated user request (Edit profile)

Each authenticated user can edit his own profile by clicking on the username on the top right corner of the admin console window.

When submitting, a new user request is generated and forwarded to designated administrators. Such request will be managed similarly to self-registration requests.
