

Serialization

Serialization

Serialization is a [Data Format](#) which uses the standard Java Serialization mechanism to unmarshal a binary payload into Java objects or to marshal Java objects into a binary blob.

For example the following uses Java serialization to unmarshal a binary file then send it as an ObjectMessage to [ActiveMQ](#)

```
from("file://foo/bar").
    unmarshal().serialization().
    to("activemq:Some.Queue");
```

Dependencies

This data format is provided in **camel-core** so no additional dependencies is needed.
