

# JCR

## JCR Component

The `jcr` component allows you to add/read nodes to/from a JCR compliant content repository (for example, [Apache Jackrabbit](#)) with its producer, or register an `EventListener` with the consumer.

Maven users will need to add the following dependency to their `pom.xml` for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-jcr</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

## URI format

```
jcr://user:password@repository/path/to/node
```

### Consumer added

From **Camel 2.10** onwards you can use consumer as an `EventListener` in JCR or a producer to read a node by identifier.

## Usage

The `repository` element of the URI is used to look up the `JCR Repository` object in the Camel context registry.

### Producer

Name	Default Value	Description
<code>CamelJcrOperation</code>	<code>CamelJcrInsert</code>	CamelJcrInsert or CamelJcrGetById operation to use
<code>CamelJcrNodeName</code>	<code>null</code>	Used to determine the node name to use.
<code>CamelJcrNodeType</code>	<code>null</code>	<b>Camel 2.16:</b> To use a specify primary node type when creating adding a new node.

When a message is sent to a JCR producer endpoint:

- If the operation is `CamelJcrInsert`: A new node is created in the content repository, all the message headers of the IN message are transformed to `javax.jcr.Value` instances and added to the new node and the node's UUID is returned in the OUT message.
- If the operation is `CamelJcrGetById`: A new node is retrieved from the repository using the message body as node identifier.

Please note that the JCR Producer used message properties instead of message headers in Camel versions earlier than 2.12.3. See <https://issues.apache.org/jira/browse/CAMEL-7067> for more details.

### Consumer

The consumer will connect to JCR periodically and return a List<`javax.jcr.observation.Event`> in the message body.

Name	Default Value	Description
<code>eventTypes</code>	<code>0</code>	A combination of one or more event types encoded as a bit mask value such as <code>javax.jcr.observation.Event.NODE_ADDED</code> , <code>javax.jcr.observation.Event.NODE_REMOVED</code> , etc.
<code>deep</code>	<code>false</code>	When it is true, events whose associated parent node is at current path or within its subgraph are received.
<code>uuids</code>	<code>null</code>	Only events whose associated parent node has one of the identifiers in the comma separated uuid list will be received.

nodeTypeNames	null	Only events whose associated parent node has one of the node types (or a subtype of one of the node types) in this list will be received.
noLocal	false	If noLocal is true, then events generated by the session through which the listener was registered are ignored. Otherwise, they are not ignored.
sessionLiveCheckInterval	60000	Interval in milliseconds to wait before each session live checking.
sessionLiveCheckIntervalOnStart	3000	Interval in milliseconds to wait before the first session live checking.
username		<b>Camel 2.15:</b> Allows to specify the username as a uri parameter instead of in the authority section of the uri
password		<b>Camel 2.15:</b> Allows to specify the password as a uri parameter instead of in the authority section of the uri
workspaceName	null	<b>Camel 2.16:</b> Allows to specify a workspace different from default

## Example

The snippet below creates a node named `node` under the `/home/test` node in the content repository. One additional property is added to the node as well: `my.contents.property` which will contain the body of the message being sent.

```
from("direct:a").setHeader(JcrConstants.JCR_NODE_NAME, constant("node"))
    .setHeader("my.contents.property", body())
    .to("jcr://user:pass@repository/home/test");
```

The following code will register an `EventListener` under the path `import-application/inbox` for `Event.NODE_ADDED` and `Event.NODE_REMOVED` events (event types 1 and 2, both masked as 3) and listening deep for all the children.

```
<route>
  <from uri="jcr://user:pass@repository/import-application/inbox?eventTypes=3&deep=true" />
  <to uri="direct:execute-import-application" />
</route>
```
