

Creating a Maven Integration Test

Naming your Test

In the past, tests were numbered sequentially (it001, it002, etc). This becomes problematic because it's not always obvious what the issue is related to the test. More importantly, it's hard to create and submit sequential tests via patches because non-committers have no way to reserve the next number. This leads to extra work to apply the patch.

New tests should be named using the JIRA issue id along with a meaningful name. This name should typically be the subject of the issue or a subset. It should be informative of the issue but not excessively long. Therefore a good name would be: `MavenITmng1234groupIdOrderIsBackwardsTest`. The corresponding resource directory for this test in `core-it-suite/src/test/resources/` would simply be named `mng-1234`, i.e. without the description to keep the path short.

Sample IT Project

A sample project has been created to aid in IT test creation. It can be retrieved using Subversion from our [source repository](#) or directly viewed with your browser via our [SVN view](#).

Sample IT Archetype

This project has also been converted into an archetype to make it even easier to use.

It would be helpful to review the archetype plugin documentation here: <http://maven.apache.org/plugins/maven-archetype-plugin/>

The Archetype Plugin doesn't currently know about this archetype, so we created a catalog file to be used.

```
mvn archetype:generate -DarchetypeCatalog=http://docs.codehaus.org/download/attachments/1835439/archetype-catalog.xml
```

```

$ mvn archetype:generate -DarchetypeCatalog=http://docs.codehaus.org/download/attachments/1835439/archetype-
catalog.xml

```

The project will be created in a subfolder of your current directory with the name you chose for the artifact. (my-it in the above example).

Tour of the Sample Project

The sample IT project contains the following files:

```

|   pom.xml
|
\---src
    \---test
        +---java
            |   \---org
            |       \---apache
            |           \---maven
            |               \---it
            |                   |   MavenITmngXXXXDescriptionOfProblemTest.java
            |
            \---resources
                \---mng-xxxx
                    |   pom.xml
                    |   readme.txt
                    |
                    +---checkstyle-assembly
                    |   |   pom.xml
                    |   |
                    |   +---src
                    |       |   \---main
                    |           |   \---resources
                    |               |   rule_set.xml
                    |               |   stc_checks.xml
                    |
                    \---checkstyle-test
                        |   pom.xml
                        |
                        \---src
                            |   \---main
                            |       \---java
                            |           Class.java

```

The directory `src/test/java/` contains a junit file used to execute the sample project. It is heavily commented to guide you along. Stop here and [Take a look](#) before continuing.

The directory `src/test/resources` contains a sample project tree that will be invoked to test our condition. The sample consists of a few modules, first an extension ([checkstyle-assembly](#)) that is jarred up and installed into the repository. Then a second invocation is made on a project that uses the extension ([checkstyle-test](#))

The sample IT project uses the simplest method of using the verifier, that is the sample build fails if the test should fail. More complicated ITs can be created with beanshell scripts to check complex conditions. (Example Needed) ([Link to verifier docs](#))

Once your IT is complete, you should be able to execute it:

```

>mvn test

```

Submitting your IT Test

Now that your IT is complete, create a zip, tgz or some other *normal* archive of your test and attach it to your JIRA issue.

If you are a Maven committer, read the next section to see how to integrate your test into the core, or to apply someone else's test.

Integrating an IT into the core-integration-tests

First, check out the [core-it-suite](#)

The sample project maps directly to the core-it-suite structure. Assuming the test has been named uniquely, you can copy the contents of src/test directly over to core-it-suite (don't copy from the root or you'll overwrite the POM).

```
/cygdrive/e/svn/Maven/maven-it-tests/core-it-suite
$ cp ../test/artifact/src . -R -v
`../test/artifact/src/test/java/org/apache/maven/it/MavenITmngXXXXDescriptionOfProblemTest.java' -> `./src/test
/java/org/apache/maven/it/MavenITmngXXXXDescriptionOfProblemTest.java'
`../test/artifact/src/test/resources/mng-xxxx/checkstyle-assembly/pom.xml' -> `./src/test/resources/mng-xxxx
/checkstyle-assembly/pom.xml'
`../test/artifact/src/test/resources/mng-xxxx/checkstyle-assembly/src/main/resources/rule_set.xml' -> `./src
/test/resources/mng-xxxx/checkstyle-assembly/src/main/resources/rule_set.xml'
`../test/artifact/src/test/resources/mng-xxxx/checkstyle-assembly/src/main/resources/stc_checks.xml' -> `./src
/test/resources/mng-xxxx/checkstyle-assembly/src/main/resources/stc_checks.xml'
`../test/artifact/src/test/resources/mng-xxxx/checkstyle-assembly/target/classes/rule_set.xml' -> `./src/test
/resources/mng-xxxx/checkstyle-assembly/target/classes/rule_set.xml'
`../test/artifact/src/test/resources/mng-xxxx/checkstyle-assembly/target/classes/stc_checks.xml' -> `./src/test
/resources/mng-xxxx/checkstyle-assembly/target/classes/stc_checks.xml'
`../test/artifact/src/test/resources/mng-xxxx/checkstyle-test/pom.xml' -> `./src/test/resources/mng-xxxx
/checkstyle-test/pom.xml'
`../test/artifact/src/test/resources/mng-xxxx/checkstyle-test/src/main/java/Class.java' -> `./src/test/resources
/mng-xxxx/checkstyle-test/src/main/java/Class.java'
`../test/artifact/src/test/resources/mng-xxxx/pom.xml' -> `./src/test/resources/mng-xxxx/pom.xml'
`../test/artifact/src/test/resources/mng-xxxx/readme.txt' -> `./src/test/resources/mng-xxxx/readme.txt'
```

Now add your test to the test suite by adding a new line to `src\test\java\org\apache\maven\it\IntegrationTestSuite.java`

```
suite.addTestSuite( MavenITmngXXXXDescriptionOfProblemTest.class );
```

Now run the suite:

```

brianf@sonoma /cygdrive/e/svn/Maven/maven-it-tests/core-it-suite
$ mvn test

Don't panic if some tests fail. That's probably normal. Only panic if your test doesn't fail and it was supposed to (especially if you didn't write it).

Now add all those new files to svn (you can figure this one out on your own by now...you're an expert...and its late here) and commit.
